PPL UIUC

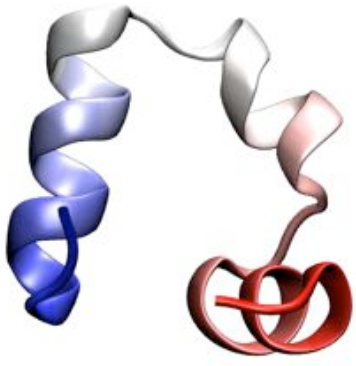
Viewing the 10 μs Folding of a Protein

- Solvated system is ~30,000 atoms
- Simulated in NAMD using CHARMM22/ CMAP
- ~100 ns/day on 329 processors
- Starting conformations either fully extended or thermally denatured
- Three independent WT simulations done
- Six mutant simulations
- Altogether over 50 μs of simulation
- Simulations of WW domain reveal deficit of force field

Protein dynamics in cells go out to a millisecond and longer. We recently increased computational time scales from 100 ns to 60 microseconds!

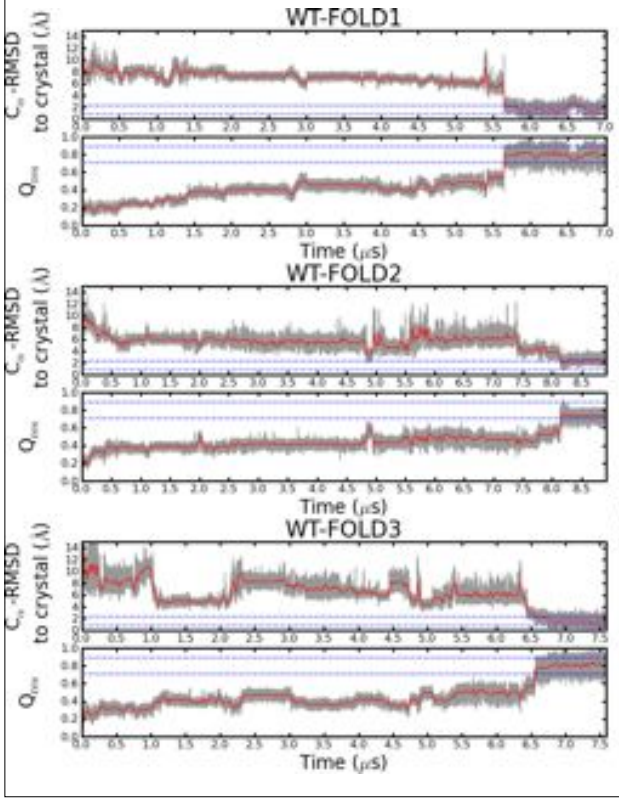
Over **50 microsecond** of protein folding

WT villin head piece; exp 4 μs, sim 6 μs

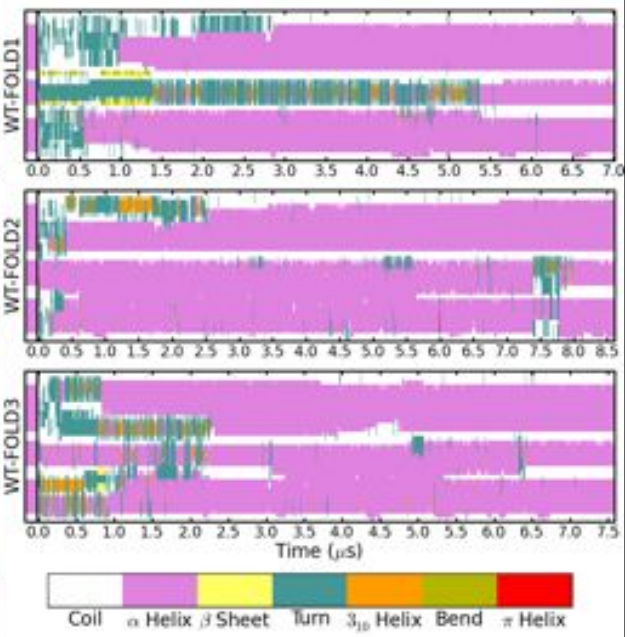


Folding WT villin *in silico*

Three folding simulations reach native state within 5-8 μs



Use VMD TimeLine tool!



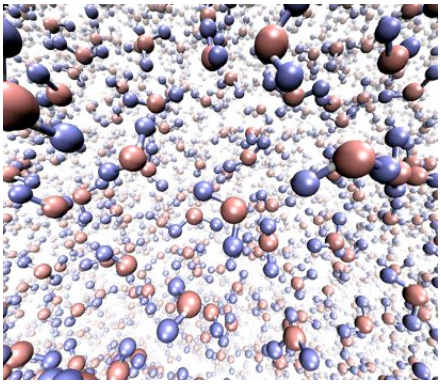
FAQ: Did you test if states reached remain stable? Yes, for 1 μs.

100 - 1,000,000 processors

Implementing Polarizable Force Fields into NAMD

Atomic polarizability not yet accounted for in modeling. Respective force fields are being developed; here the fluctuating charge model of Brooks et al.

Polarizable water; fluct. charge



Goal: Realize polarizable force fields in our modeling program effectively.

FG-nup Binding Pattern

How does the NPC distinguish between transport receptors and inert macromolecules?

- Any macromolecule may have random FG-nup binding spots
- Transport receptors exhibit a *particular* surface binding spot *pattern*
  - *Binding spots tend to be clustered with a ~14 Å spacing between spots*

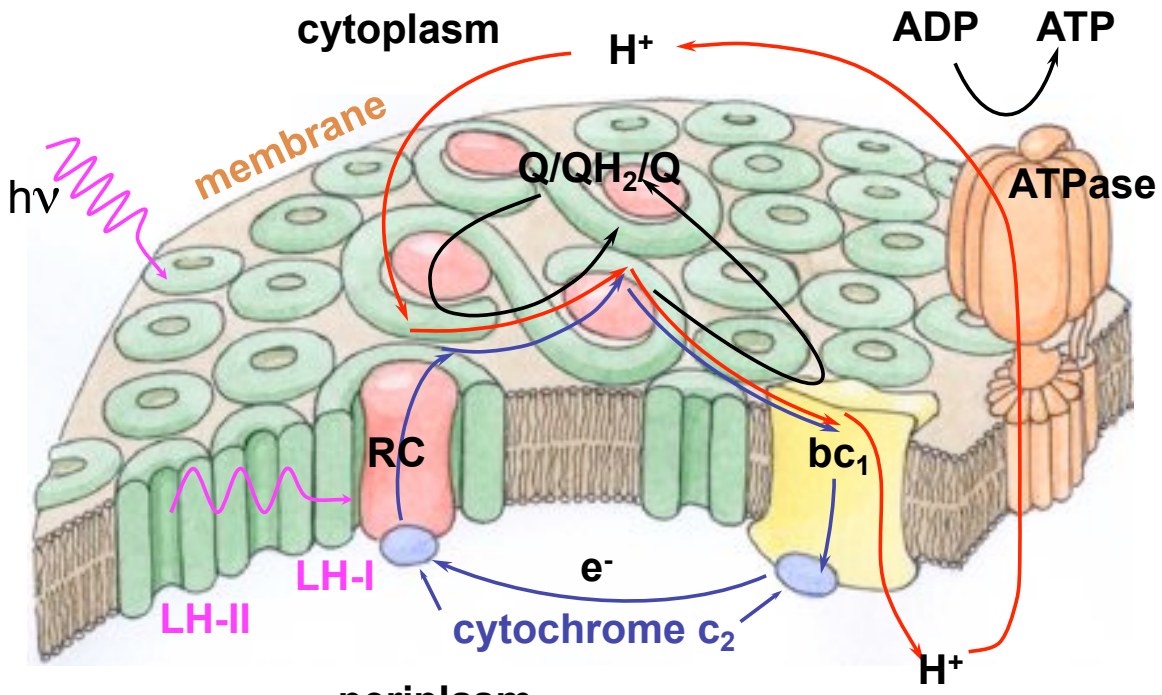
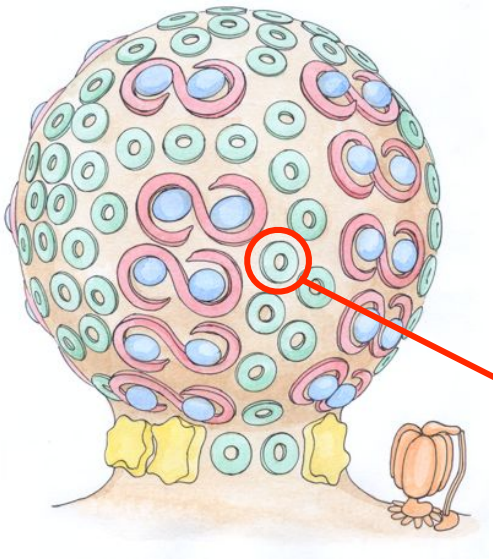
Chromatophore of Purple Bacteria

(section of the chromatophore membrane)



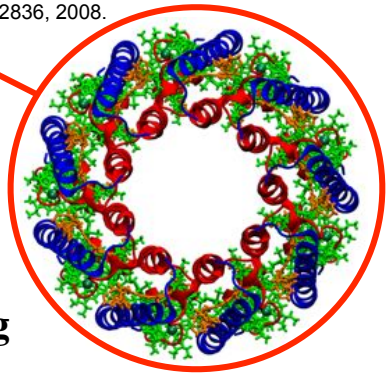
Xiche Hu, Thorsten Ritz, Ana Damjanovic, Felix Autenrieth, and Klaus Schulten. Photosynthetic apparatus of purple bacteria. *Quarterly Reviews of Biophysics*, 35:1-62, 2002.

Component 1: Light Harvesting Complex 2 (LH2)



- **LH2 absorbs light via its bacteriochlorophylls (below in Green)**
- **This energy is transferred to the LH1 where the reaction center utilizes it to pump electrons across the membrane**
- **LH2 complexes form the bulk of chromatophore membranes and are integral to both its structure and function**

Danielle Chandler, Jen Hsin, Christopher B. Harrison, James Gumbart, and Klaus Schulten. **Intrinsic curvature properties of photosynthetic proteins in chromatophores.** *Biophysical Journal*, 95:2822-2836, 2008.



Structure of LH2 established by crystallography & homology modeling

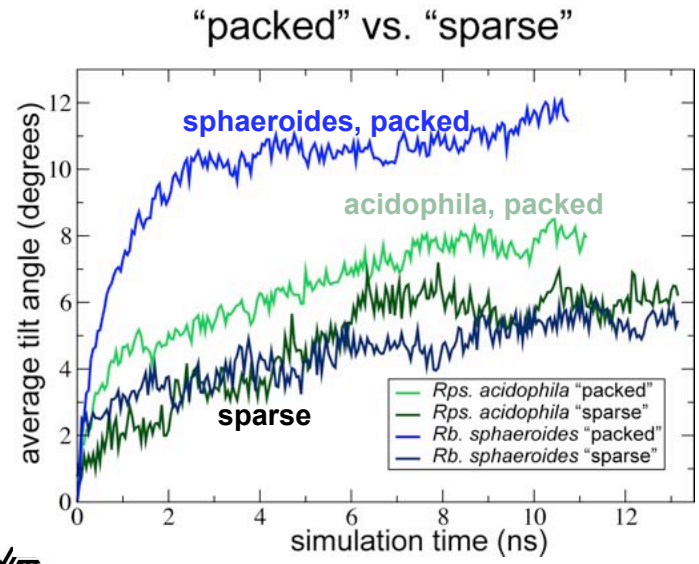
LH2

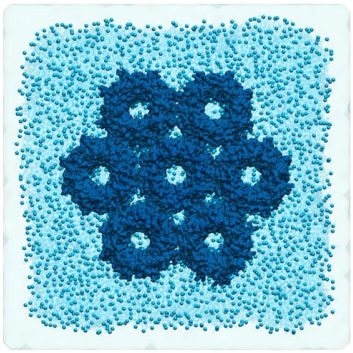
LH2 aggregates induce curvature via packing

7 hexagonally-packed LH2s

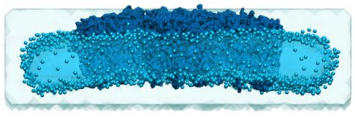
"packed" → no lipids between LH2s

"sparse" → one layer of lipids between LH2s

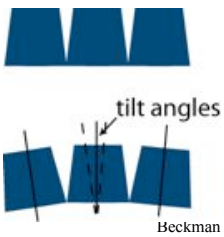




top view

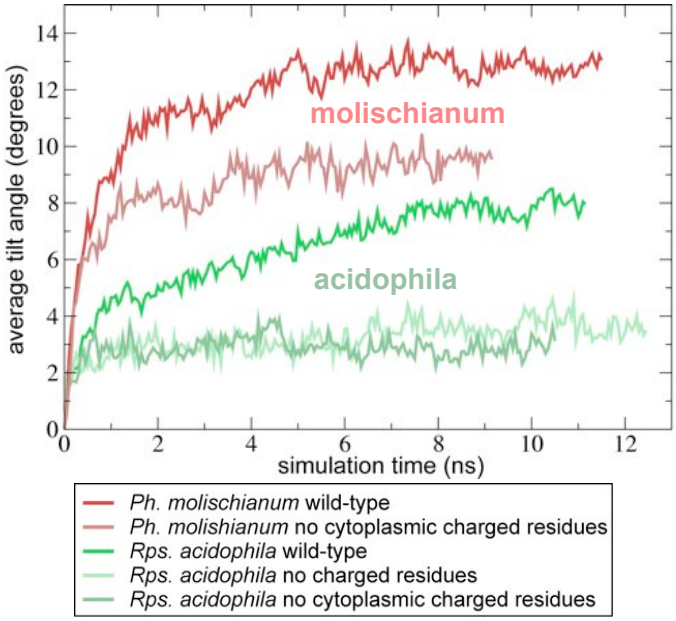


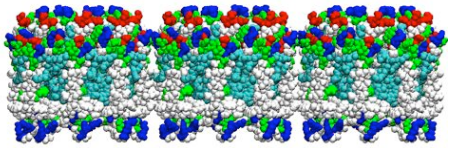
side view after 12 ns



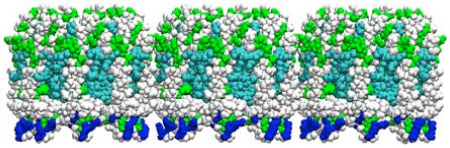
LH2 curvature partially driven by electrostatics

curvature is reduced by removal of conserved cytoplasmic charged residues





Ph. molischianum wild-type

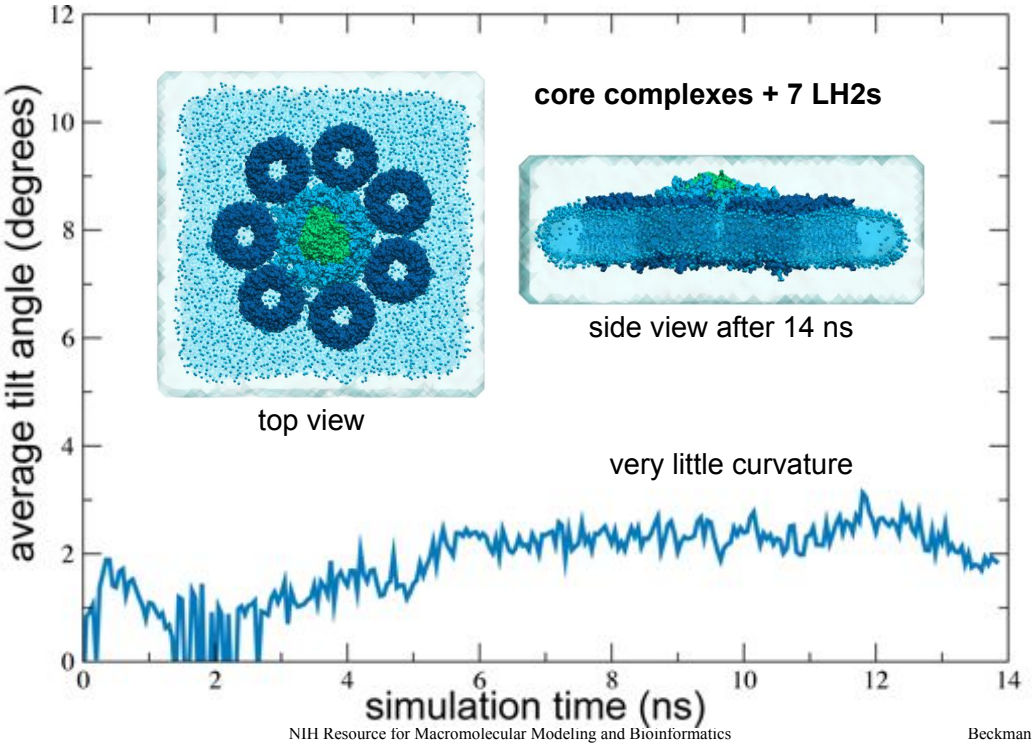


Ph. molischianum modified

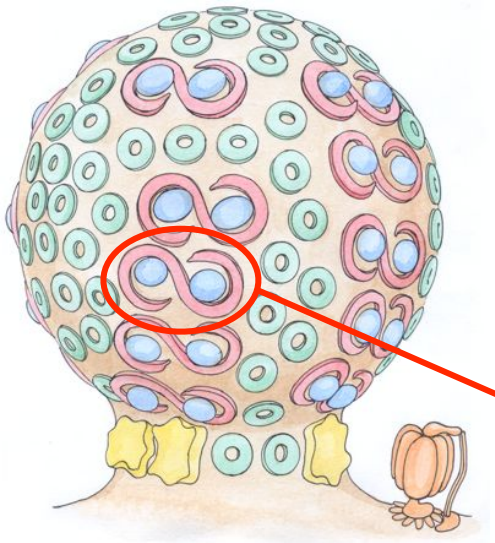
Much reduced curvature in LH1-LH2 mixed system

LH1 monomer surrounded by seven LH2 complexes

(LH1 and LH2 from *Rps. acidophila*, RC from *Rb. sphaeroides*)



Component 2: Light Harvesting Complex 1 (LH1)



- **LH1s form stacks in spherical chromatophores**

- **LH1 is dimeric multi-protein complex of**
- **•Light Harvesting Complex 1 (LH1)(Blue & Red)**
- **•Reaction Center (RC) (Green)**
- **•Puf X (Purple)**

- **LH1 absorbs light energy, transfers it to RC which uses it to pump electrons across the membrane.**

Jen Hsin, James Gumbart, Leonardo G. Trabuco, Elizabeth Villa, Pu Qian, C. Neil Hunter, and Klaus Schulten. **Protein-induced membrane curvature investigated through molecular dynamics flexible fitting.** *Biophysical Journal*, 2009. In press.
