

Statistical Mechanics of Proteins

Ubiquitin

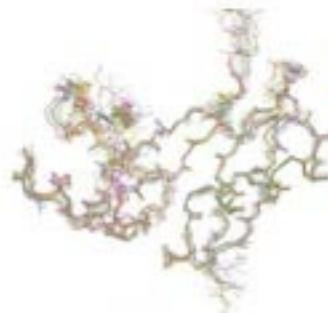

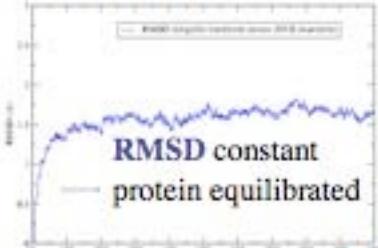

Show molecular dynamics trajectory in VMD

Equilibrium Properties of Proteins

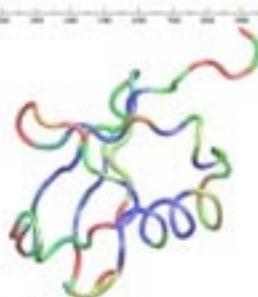

Ubiquitin

Root Mean Squared Deviation: measure for equilibration and protein flexibility

$$RMSD_{\alpha} = \sqrt{\frac{\sum_{j=1}^{N_t} \sum_{\alpha=1}^{N_a} (\langle r_{\alpha}(t_j) \rangle - \langle r_{\alpha} \rangle)^2}{N_a}}$$

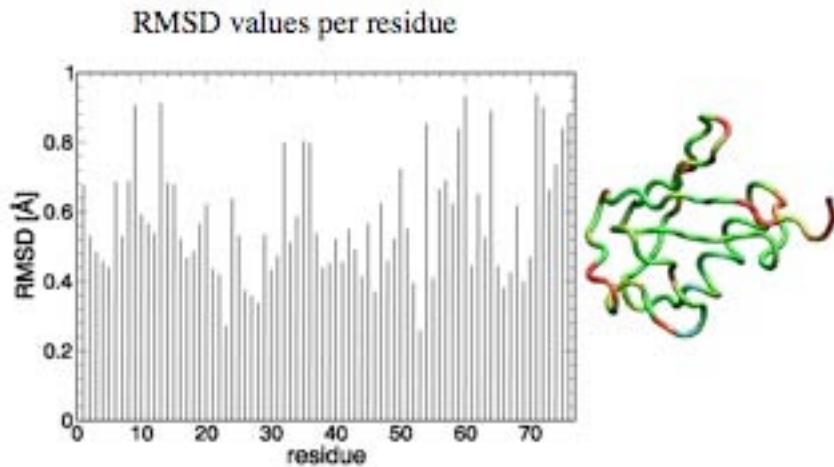

Protein sequence exhibits characteristic permanent flexibility!

NMR structures aligned together to see flexibility

MD simulation
The color represents mobility of the protein through simulation (red = more flexible)

Thermal Motion of Ubiquitin from MD

Thermal Motion of Ubiquitin from MD

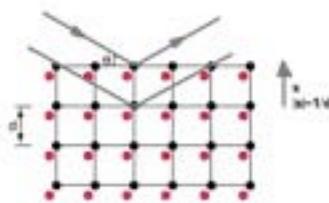

Temperature Dependence of Crystal Diffraction (Debye-Waller factor)

Bragg's law

$$2d \sin \theta = \lambda$$

structure factor

$$f_j \exp[-i\vec{s} \cdot \vec{r}_j]$$

But the atom carries out thermal vibrations around equilibrium position \vec{x}_j

$$\vec{r}_j(t) = \vec{x}_j + \vec{u}_j(t)$$

Accordingly:

$$\langle f_j \exp[-i\vec{s} \cdot \vec{r}_j] \rangle = f_j \exp[-i\vec{s} \cdot \vec{x}_j] \langle \exp[-i\vec{s} \cdot \vec{u}_j] \rangle$$

Thermal Motion of Ubiquitin from MD

Temperature Dependence of Crystal Diffraction (Debye-Waller factor)

One can expand:

$$\langle \exp[-i\vec{s} \cdot \vec{u}_j] \rangle = 1 - i \underbrace{\langle \vec{s} \cdot \vec{u}_j \rangle}_{=0} - \frac{1}{2} \langle (\vec{s} \cdot \vec{u}_j)^2 \rangle + \dots$$

Spatial average: $\langle (\vec{s} \cdot \vec{u}_j)^2 \rangle = \frac{1}{3} s^2 \langle u_j^2 \rangle$

One can carry out the expansion further and show

$$\langle \exp[-i\vec{s} \cdot \vec{u}_j] \rangle = \exp \left[-\frac{1}{6} s^2 \langle u_j^2 \rangle \right]$$

Using for the thermal amplitude of the harmonic oscillator

$$\frac{1}{2} m \omega^2 u_j^2 = \frac{3}{2} k_B T$$

one obtains

Debye-Waller factor

$$\langle f_j \exp[-i\vec{s} \cdot \vec{r}_j] \rangle = f_j \overbrace{\exp[-s^2 k_B T / 2m\omega^2]}^{\text{Debye-Waller factor}} \exp[-i\vec{s} \cdot \vec{x}_j]$$

Equilibrium Properties of Proteins

Energies: kinetic and potential

?

temperature dependence

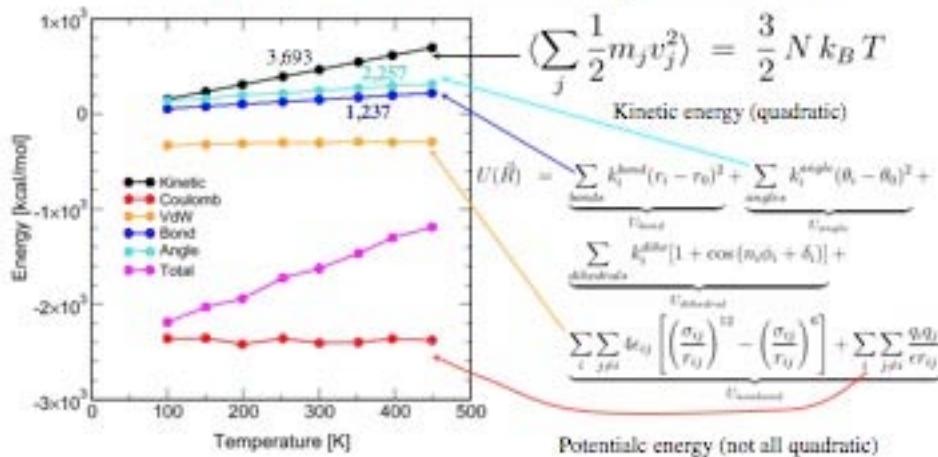

$$U(\vec{R}) = \underbrace{\sum_{\text{bonds}} k_i^{\text{bond}} (r_i - r_0)^2}_{U_{\text{bond}}} + \underbrace{\sum_{\text{angles}} k_i^{\text{angle}} (\theta_i - \theta_0)^2}_{U_{\text{angle}}} + \underbrace{\sum_{\text{dihedrals}} k_i^{\text{dihed}} [1 + \cos(n_i \phi_i + \delta_i)] +}_{U_{\text{dihedrals}}} \underbrace{\sum_{i,j \neq i} \sum_{i,j \neq i} k_{ij} \left[\left(\frac{\sigma_{ij}}{r_{ij}} \right)^{12} - \left(\frac{\sigma_{ij}}{r_{ij}} \right)^6 \right]^2}_{U_{\text{nonbond}}} + \sum_{i,j \neq i} \frac{q_i q_j}{\epsilon r_{ij}}$$

Kinetic energy (quadratic)

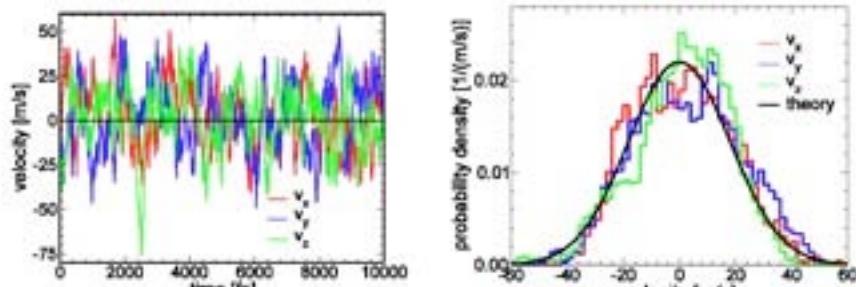

Potential energy (not all quadratic)

Equilibrium Properties of Proteins

Energies: kinetic and potential

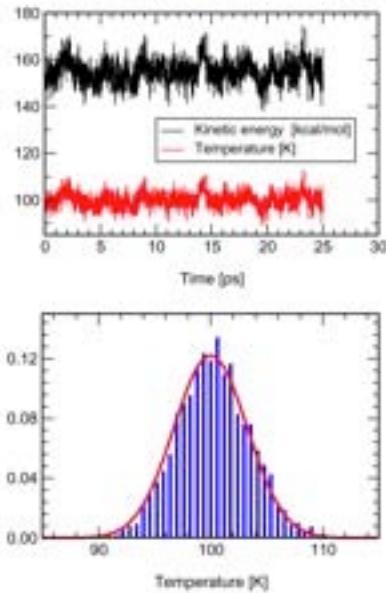

Maxwell Distribution of Atomic Velocities

$$p(v_\sigma) = \sqrt{\frac{m}{2\pi k_B T}} \exp \left[-\frac{mv_\sigma^2}{2k_B T} \right]$$

$$\sigma = x, y, z$$

Analysis of E_{kin} , T (free dynamics)

Definition of Temperature

$$\langle \sum_j \frac{1}{2} m_j v_j^2 \rangle = \frac{3}{2} N k_B T$$

$$T = \frac{2}{3N k_B} \langle \sum_j \frac{1}{2} m_j v_j^2 \rangle$$

The atomic velocities of a protein establish a thermometer, but is it accurate?

Temperatur Fluctuations

Maxwell distribution

The atomic velocity thermometer is inaccurate due to the finite size of a protein!

$$dP(v_n) = c \exp(-m v_n^2 / 2k_B T) dv_n \quad (7)$$

Individual kinetic energy $\epsilon_n = mv_n^2/2$

$$dP(\epsilon_n) = (\pi T_0 \epsilon_n)^{-1/2} \exp(-\epsilon_n/k_B T_0) d\epsilon_n \quad (8)$$

One can derive

$$\langle \epsilon_n \rangle = T_0/2 \quad (9)$$

$$\langle \epsilon_n^2 \rangle = 3T_0^2/4 \quad (10)$$

$$\langle \epsilon_n^2 \rangle - \langle \epsilon_n \rangle^2 = T_0^2/2 \quad (11)$$

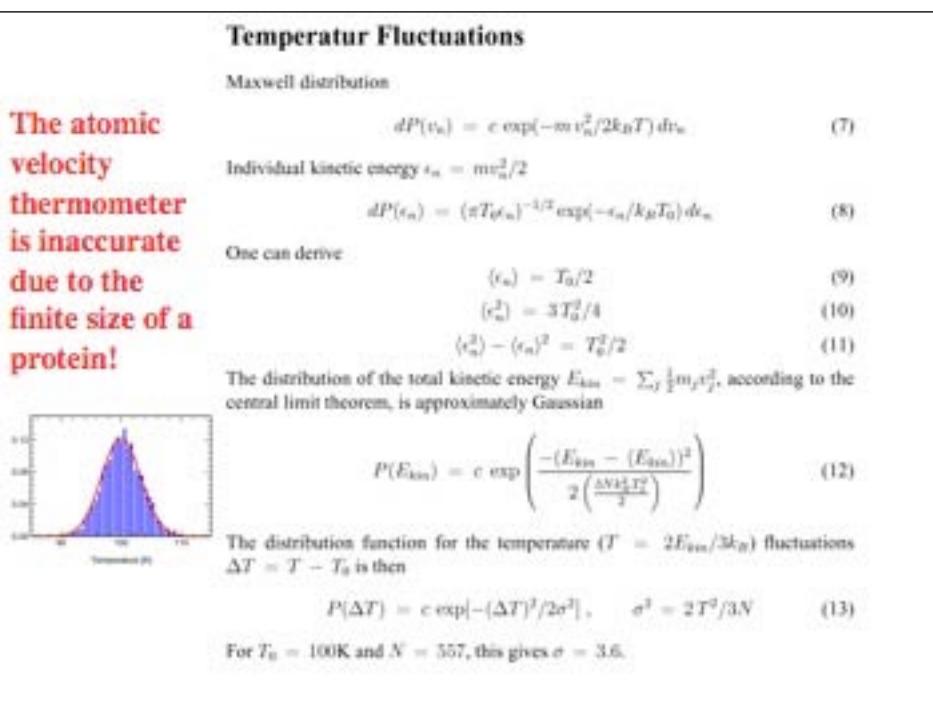

The distribution of the total kinetic energy $E_{\text{kin}} = \sum_j \frac{1}{2} m_j v_j^2$, according to the central limit theorem, is approximately Gaussian

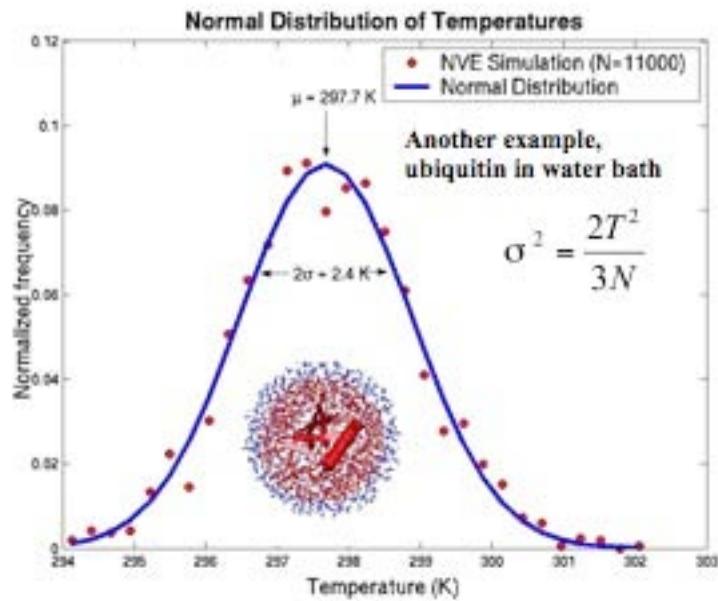

$$P(E_{\text{kin}}) = c \exp\left(\frac{-(E_{\text{kin}} - \langle E_{\text{kin}} \rangle)^2}{2 \left(\frac{\sum_j m_j T_0^2}{3}\right)}\right) \quad (12)$$

The distribution function for the temperature ($T = 2E_{\text{kin}}/3k_B$) fluctuations $\Delta T = T - T_0$ is then

$$P(\Delta T) = c \exp[-(\Delta T)^2/2\sigma^2], \quad \sigma^2 = 2T_0^2/3N \quad (13)$$

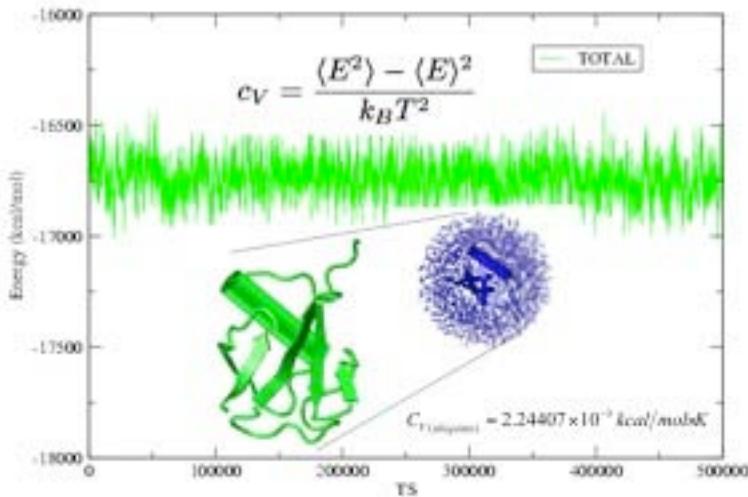

For $T_0 = 100\text{K}$ and $N = 557$, this gives $\sigma = 3.6$.

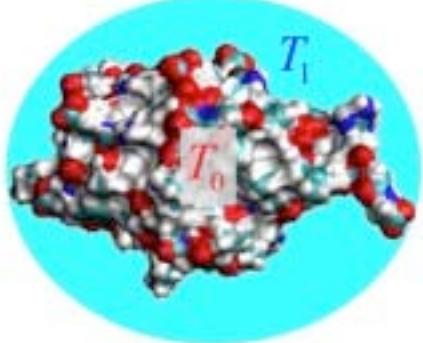

Specific Heat of a Protein

Total energy of ubiquitin (NVE ensemble)

Simulated Cooling of Ubiquitin

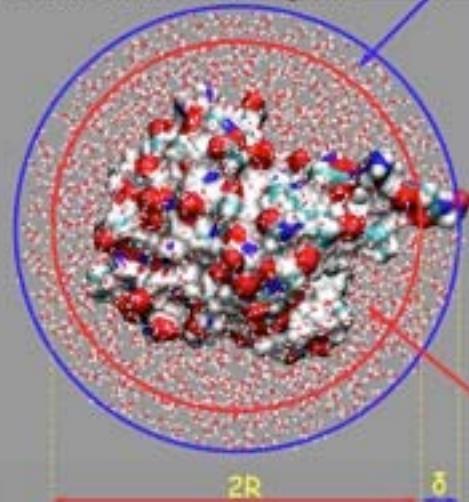

- Proteins function in a narrow (physiological) temperature range. What happens to them when the temperature of their surrounding changes significantly (temperature gradient) ?
- Can the heating/cooling process of a protein be simulated by molecular dynamics ? If yes, then how?

- What can we learn from the simulated cooling/heating of a protein ?

How to simulate cooling ?

Heat transfer through mechanical coupling between atoms in the two regions

coolant layer of atoms

motion of atoms is subject to stochastic Langevin dynamics

$$m \ddot{r} = F_{FF} + F_H + F_f + F_L$$

F_{FF} → force field

F_H → harmonic restrain

F_f → friction

F_L → Langevin force

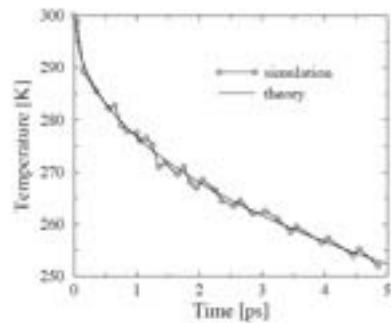

atoms in the inner region follow Newtonian dynamics

$$m \ddot{r} = F_{FF}$$

Solution of the Heat Equation

Table 1: Mean temperature (T_{ave}) [K] of the protein as a function of time t [ps].

Result from simulation

Heat Conduction Equation

$$\frac{\partial T(\mathbf{r},t)}{\partial t} = D \nabla^2 T(\mathbf{r},t)$$

thermal diffusion coefficient —

mass density

$$= D \nabla^2 T(\mathbf{r}, t)$$

mass density

$$\rightarrow D = K / \rho c$$

↑

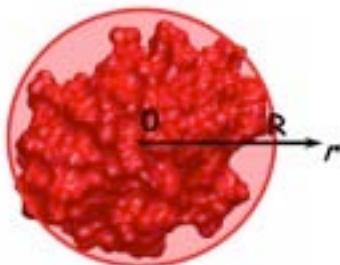

specific heat

thermal conductivity

- approximate the protein with a homogeneous sphere of radius $R \sim 20 \text{ \AA}$
 - calculate $T(r,t)$ assuming initial and boundary conditions:

$$T(r,0) = T_0 \text{ for } r < R$$

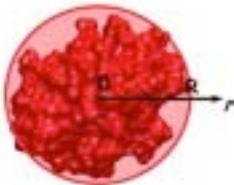

$$T(R,t) = T_{bath}$$

Solution of the Heat Equation

$$\frac{\partial T(\mathbf{r}, t)}{\partial t} = D \nabla^2 T(\mathbf{r}, t),$$
$$D = K/\rho c,$$

Initial condition

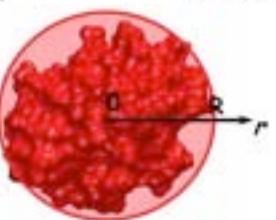

$$T(\mathbf{r}, 0) = \langle T_{sim} \rangle(0) \quad \text{for } r < R,$$

Boundary condition

$$T(R, t) = T_{bath}.$$

Solution of the Heat Equation

Spherical symmetry $\frac{\partial T(r, t)}{\partial t} = D \frac{1}{r} \partial_r^2 r T(r, t)$

We assume

$$T(r, t) = T_{bath} + \sum_{n=1}^{\infty} a_n e^{\lambda_n t} u_n(r)$$

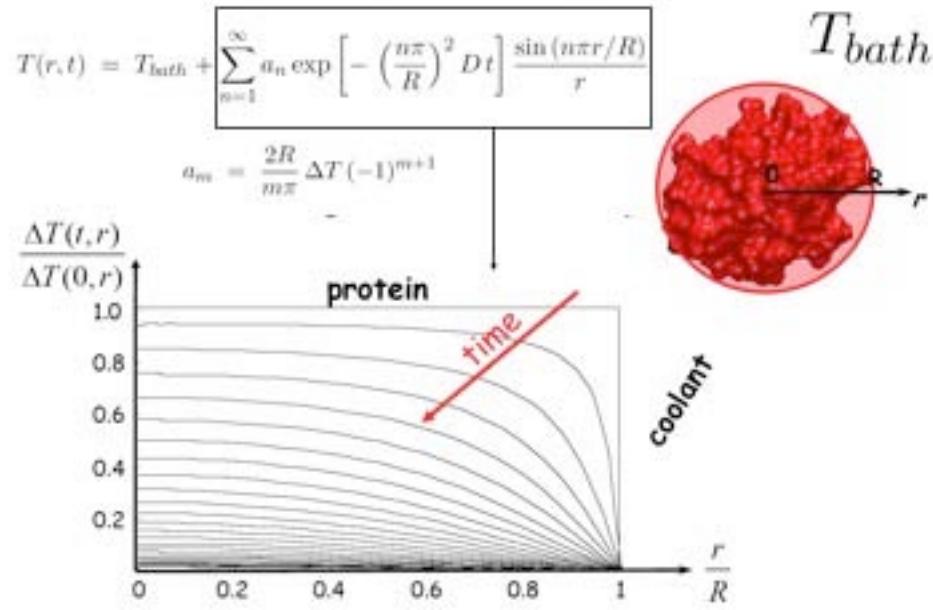

difference from bath

Here u_n are the eigenfunctions of the spherical diffusion operator

$$L \equiv \frac{D}{r} \frac{d^2}{dr^2} r$$

$$\frac{D}{r} \frac{d^2}{dr^2} r u_n(r) = \lambda_n u_n(r), \quad u_n(0) = \text{finite}, \quad u_n(R) = 0$$

Solution of the Heat Equation

Solution of the Heat Equation

Temperature averaged over volume

$$\begin{aligned} \langle T \rangle(t) &= \left(\frac{4\pi R^3}{3} \right)^{-1} \int d^3r T(r, t) = \frac{3}{R^3} \int_0^R r^2 dr T(r, t) \\ &= T_{\text{bath}} + \sum_{n=1}^{\infty} a_n \exp \left[-\left(\frac{n\pi}{R} \right)^2 D t \right] \frac{3}{R^3} \int_0^R r dr \sin \left(\frac{n\pi r}{R} \right) \\ &= T_{\text{bath}} + 6 \frac{\Delta T}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \exp \left[-\left(\frac{n\pi}{R} \right)^2 D t \right] \end{aligned}$$
