Temperature Echoes in Proteins

- Coherent motion in proteins: Echoes
- Generation of echoes in ubiquitin via velocity reassignments
 - Temperature quench echoes
 - 2) Constant velocity reassignment echoes
 - 3) Velocity reassignment echoes

temperature \Leftrightarrow velocities

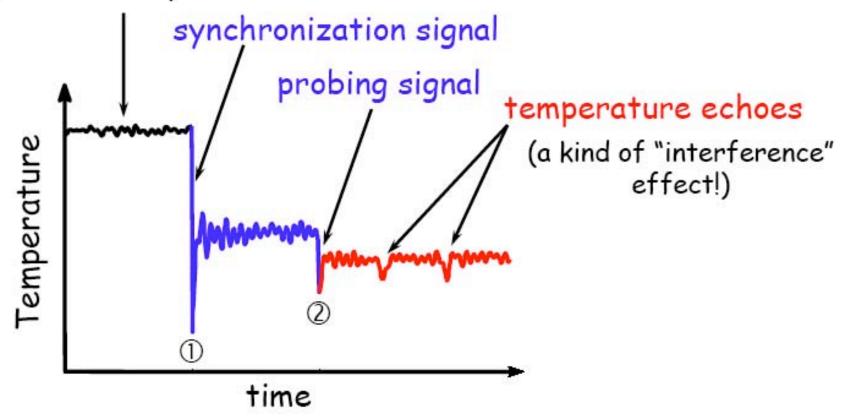

kinetic temperature:

$$T(t) = \frac{2}{(3N-6)k_B} \sum_{n=1}^{3N-6} \frac{m_n v_n^2(t)}{2}$$

Temperature Echoes

- are sharp, resonance-like features in the time evolution of the protein's temperature
- can be produced through 2 consecutive velocity reassignments

protein in equilibrium

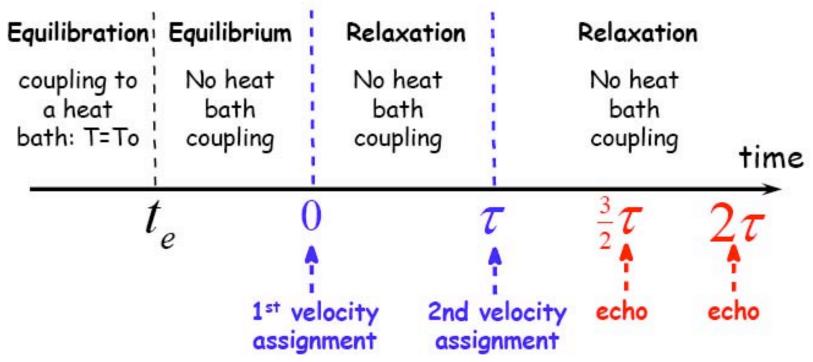

Velocity Reassignments

- ▶protein ≈ collection of weakly interacting harmonic oscillators having different frequencies
- Lat t_1 =0 the 1st velocity reassignment: $v_i(0)=\lambda_1 u_i$ synchronizes the oscillators (i.e., make them oscillate in phase)
- Lat $t_2 = \tau$ (delay time) the 2^{nd} velocity reassignment: $v_i(\tau) = \lambda_2 u_i$ probes the degree of coherence of the system at that moment
- degree of coherence is characterized by:
- the time(s) of the echo(es)
- the depth of the echo(es)

$$\lambda_1 = \lambda_2 = 0 \implies$$
 temperature quench $\lambda_1 = \lambda_2 = 1 \implies$ constant velocity reassignment $\lambda_1 \neq \lambda_2 \neq 1 \implies$ velocity reassignment

Producing Temperature Echoes by Velocity Reassignments in Proteins

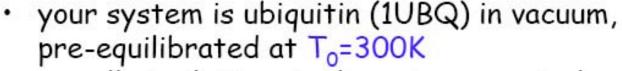

Temperature quench echoes:

$$v_{i}(0) = v_{i}(\tau) = 0$$

Const velocity reassignment echoes: $v_i(0) = v_i(\tau) = u_i$

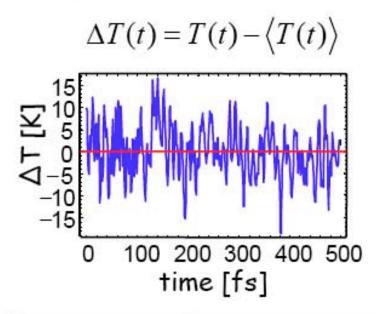

Generating T-Quench Echo: Step1

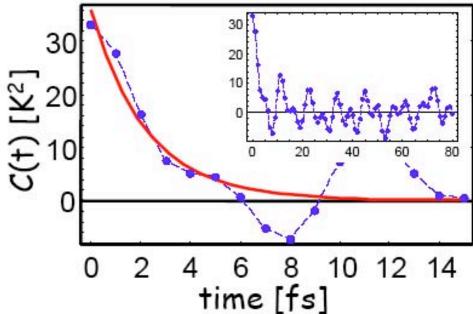

- run all simulations in the microcanonical (NVE) ensemble
- psf, pdb and starting binary coordinate and velocity files are available in "common/"
- use NAMD2 configuration file "equil.conf" located in "01_equil_NVE/" to complete a 500 fs (# simulation steps) run
- extract the temperature time series T(t) from the NAMD2 log (output) file
- plot T(t)
- calculate: $\langle T \rangle$, $\sqrt{\langle T^2 \rangle}$, $C_{TT} = \langle \delta T(t) \, \delta T(0) \rangle$

 T/T_0

Temperature Autocorrelation Function

$$C(t) = \left\langle \Delta T(t) \Delta T(0) \right\rangle$$

$$\to C(t_i) \approx \frac{1}{N-i} \sum_{i=1}^{N-i} \Delta T(t_{n+i}) \Delta T(t_n)$$

$$C(t) = C(0) \exp\left(-t/\tau_0\right)$$

Temperature relaxation time:

$$\tau_0 \approx 2.2 \, fs$$

Mean temperature:

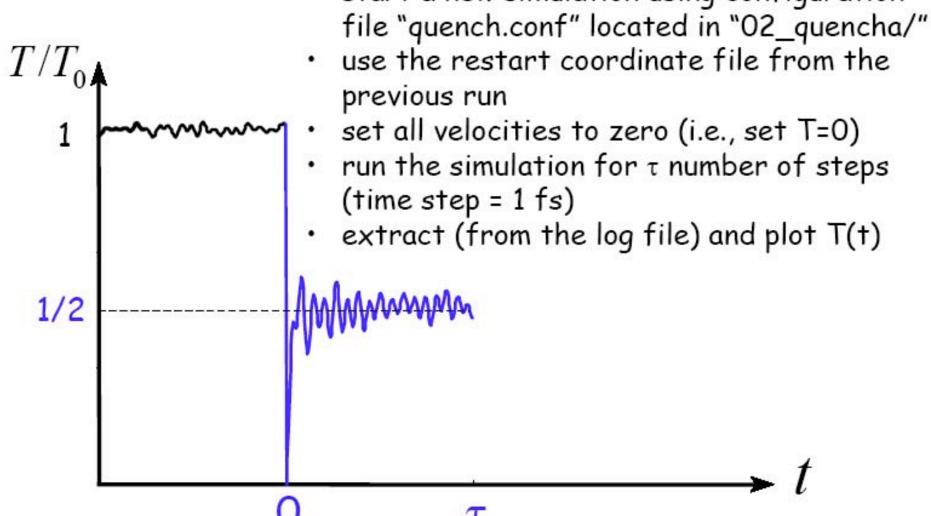

$$\langle T \rangle = 299 \, K$$

RMS temperature:

$$\sqrt{\left\langle \Delta T^2 \right\rangle} = \sqrt{C(0)} = 6 \, K$$

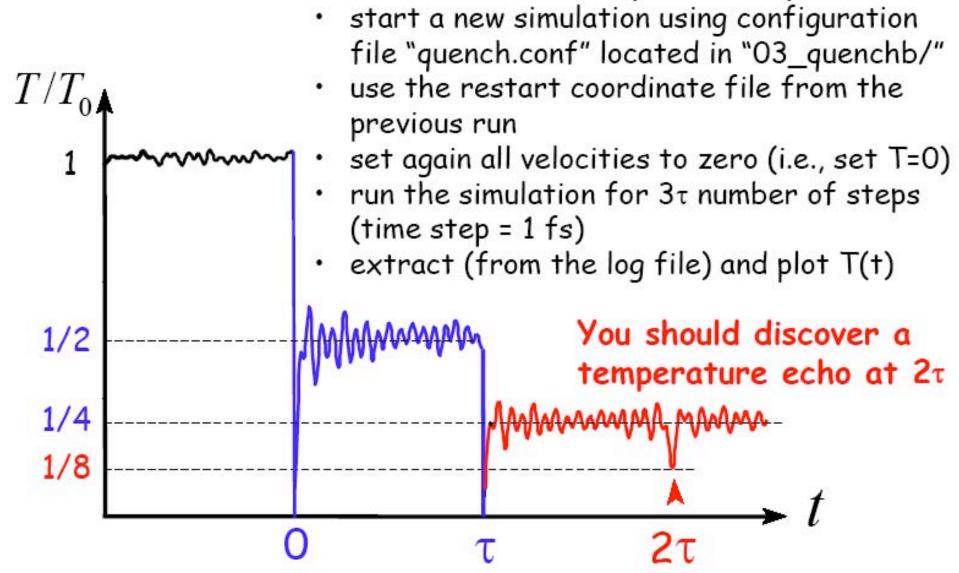

Generating T-Quench Echo: Step2

Generating T-Quench Echo: Step3

Explanation of the T-Quench Echo

Assumption: protein ≈ collection of weakly interacting harmonic oscillators with dispersion $\omega = \omega_{\alpha}$, $\alpha = 1,...,3N-6$

Step1:
$$t < 0$$
 $x(t) = A_0 \cos(\omega t + \theta_0)$
 $v(t) = -\omega A_0 \sin(\omega t + \theta_0)$

Step2: $0 < t < \tau$

$$x_1(t) = A_1 \cos(\omega t + \theta_1)$$

$$v_1(t) = -\omega A_1 \sin(\omega t + \theta_1)$$

$$\xrightarrow{v_1(0)=0}$$

$$\begin{cases} A_1 = A_0 \cos \theta_0 \\ \theta_1 = 0 \end{cases}$$

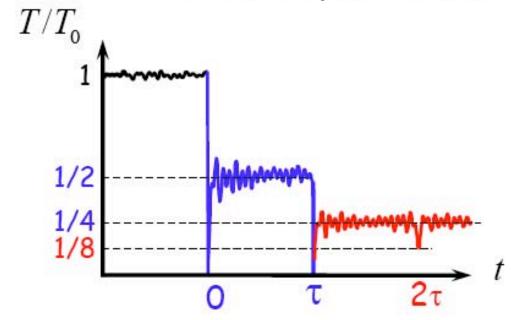

Step3:
$$t > \tau$$

$$\begin{cases} x_2(t) = A_2 \cos(\omega t + \theta_2) \\ v_2(t) = -\omega A_2 \sin(\omega t + \theta_2) \end{cases} \xrightarrow{v_2(\tau) = 0} \begin{cases} A_2 = A_1 \cos \omega \tau \\ \theta_2 = -\omega \tau \end{cases}$$

T-Quench Echo: Harmonic Approximation

$$\begin{split} T(t) \approx & \frac{T_0}{4} \Bigg[1 - \Big\langle \cos \big(2\omega(t - \tau) \big) \Big\rangle - \frac{1}{2} \Big\langle \cos \big(2\omega(t - 2\tau) \Big\rangle \Big] \\ \approx & \begin{cases} 0 & for \ t = \tau \\ T_0/8 & for \ t = 2\tau \\ T_0/4 & otherwise \end{cases} \end{split}$$

$$\Rightarrow$$
 echo depth = $T(2\tau) - T_0/4 = T_0/8$

T(t) and $C_{TT}(t)$

It can be shown:

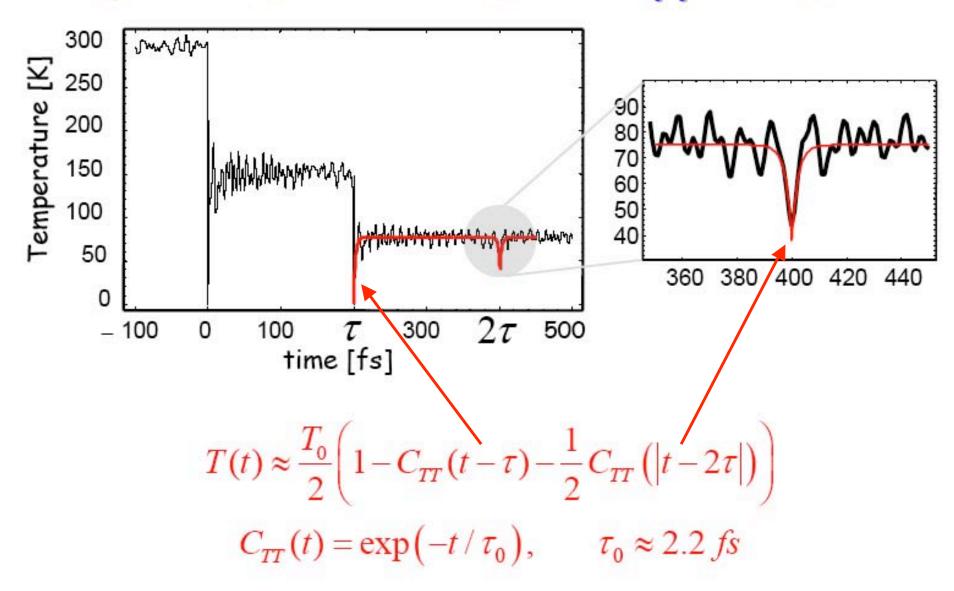

$$\langle \cos(2\omega t) \rangle = \frac{\langle \delta T(t) \delta T(0) \rangle}{\langle \Delta T^2 \rangle} = C_{TT}(t), \quad \delta T(t) = T(t) - \langle T \rangle$$

Accordingly,

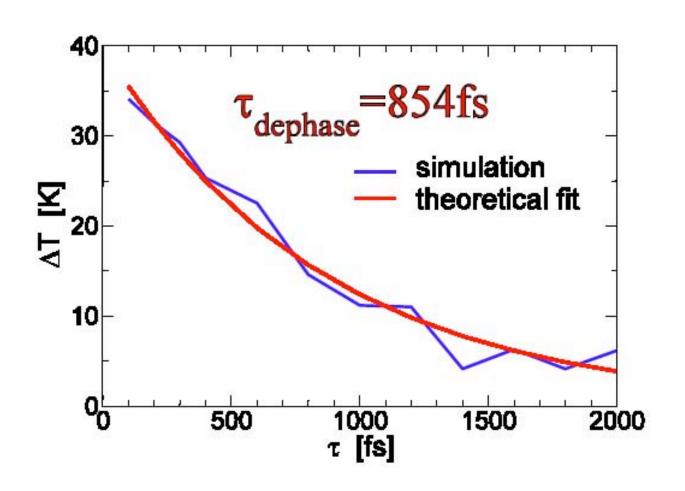

$$T(t) \approx \frac{T_0}{4} \left[1 - \langle \cos(2\omega(t-\tau)) \rangle - \frac{1}{2} \langle \cos(2\omega(t-2\tau)) \rangle \right]$$

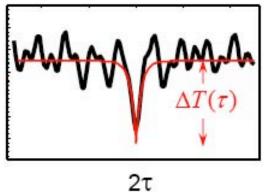

$$= \frac{T_0}{4} \left[1 - C_{TT}(t-\tau) - \frac{1}{2}C_{TT}(t-2\tau) \right]$$

T-Quench Echo: Harmonic Approximation

Dephasing Time of T-Quench Echoes

$$\Delta T(\tau) = \Delta T(0) \exp[-\tau / \tau_{dephase}]$$

Constant Velocity Reassignment Echo?

Can we get temperature echo(es) by reassigning the same set of atomic velocities (corresponding to T_0 !)

at
$$t = 0$$
 and $t = \tau$? $v_i(0^+) = v_i(\tau^+) = u_i, i = 1,...,3N - 6$
