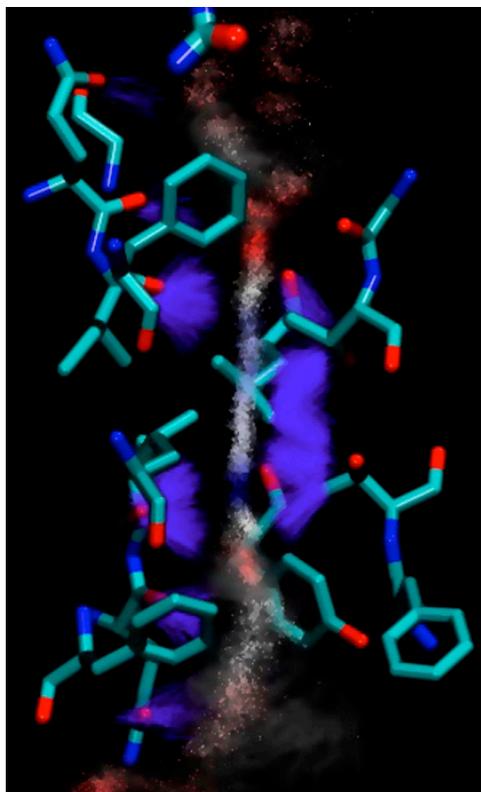

**Fig. S1.** Purification of human UT-B. (A) Size exclusion FPLC chromatogram showing normalized absorbance at 280 nm from bovine (black) and human (red) UT-B solubilized in DM. (B) SDS-PAGE gel of fractions eluted from an IMAC column after addition of 20 mM imidazole (Lane 1) or 300 mM imidazole after (Lane 2) or before (Lane 3) cleavage with TEV protease.

**Movie S1.** Urea permeation through UT-B. Translocation pathway and mechanism of urea permeation through monomeric UT-B as described by the molecular dynamics simulations. The trajectories of neighboring umbrella sampling windows were combined such that subsequent frames used for generating the animation are not separated by more than 1.5 Å with regard to the RMSD of urea heavy atoms. The  $S_i$ ,  $S_m$ , and  $S_o$  regions and urea are shown in licorice. The dots represent all positions sampled by urea in the umbrella sampling trajectories and are colored based on PMF values of that region (low  $\Delta G$  to high  $\Delta G$ : red to white to blue). Purple lines indicate the hydrogen bonds between urea and the oxygen ladders as well as T172 and T334.
