INTRODUCTION

The race for longer and larger simulations

What is the best method for a given problem?

ALCHEMICAL FREE-ENERGY CALCULATIONS

- A tool to address host-guest chemistry questions
- Good practices, guidelines and recommendations

GEOMETRICAL FREE-ENERGY CALCULATIONS

- Potentials of mean force and transport phenomena
- Potentials of mean force and recognition and association phenomena
- What about non-equilibrium work computer experiments?

INTRODUCTION

The race for longer and larger simulations

What is the best method for a given problem?

ALCHEMICAL FREE-ENERGY CALCULATIONS

- A tool to address host-guest chemistry questions
- Good practices, guidelines and recommendations

GEOMETRICAL FREE-ENERGY CALCULATIONS

- Potentials of mean force and transport phenomena
- Potentials of mean force and recognition and association phenomena
- What about non-equilibrium work computer experiments?

THE RACE FOR LONGER AND LARGER SIMULATIONS

First molecular dynamics simulation. Phase transition in model liquids.

$$\begin{cases} m_i \frac{d^2 x_i}{dt^2} = F_i \\ F_i = -\frac{\partial U(\mathbf{x})}{\partial x_i} \end{cases}$$

A TURNING POINT IN COMPUTATIONAL STRUCTURAL BIOLOGY

First molecular dynamics simulation applied to a small protein, BPTI, over 8 ps.

Alder, B. J.; Wainwright, T. E. *J. Chem. Phys.*, **1957**, *27*, 1208-1209

McCammon, J. A.; Gelin, B. R.; Karplus, M. *Nature*, **1977**, *267*, 585-590

THE RACE FOR LONGER AND LARGER SIMULATIONS

Brute-force simulations struggling to bridge the gap between time and size scales

Free-energy calculations are computational tweezers to anatomize and explore relevant degrees of freedom

WHAT ARE FREE-ENERGY CALCULATIONS COMMONLY USED FOR ?

Recognition and association phenomena

- protein-ligand binding
- site-directed mutagenesis
- protein-protein binding
- partition coefficients
- permeabilities
- activation barriers
- structural modifications

Transport phenomena

Conformational transitions

WHAT IS THE BEST METHOD FOR A GIVEN PROBLEM ?

Free-energy differences can be estimated computationally following four possible routes

(1) Methods based on histograms

(2) Non-equilibrium work simulations

(3) Perturbation theory

(4) Measuring the derivative and integrating it

$$\Delta A(\xi) = -\frac{1}{\beta} \ln P(\xi) + \Delta A_0$$

$$\exp(-\beta \Delta A) = \langle \exp(-\beta w) \rangle$$

$$\exp(-\beta \Delta A) = \langle \exp(-\beta \Delta U) \rangle_0$$

$$\frac{dA(\xi)}{d\xi} = \left\langle \frac{\partial U}{\partial \xi} - \frac{1}{\beta} \frac{\partial \ln |J|}{\partial \xi} \right\rangle_{\xi}$$

Zwanzig, R. W. *J. Chem. Phys.* **1954**, *22*, 1420-1426Pohorille, A.; Jarzynski, C.; Chipot, C. *J. Phys. Chem. B* **2010**, *114*, 10235-10253Kirkwood, J. G. *J. Chem. Phys.* **1935**, *3*, 300-313Carter, E. et al. *Chem. Phys. Lett.* **1989**, *156*, 472-477

WHAT IS THE BEST METHOD FOR A GIVEN PROBLEM ?

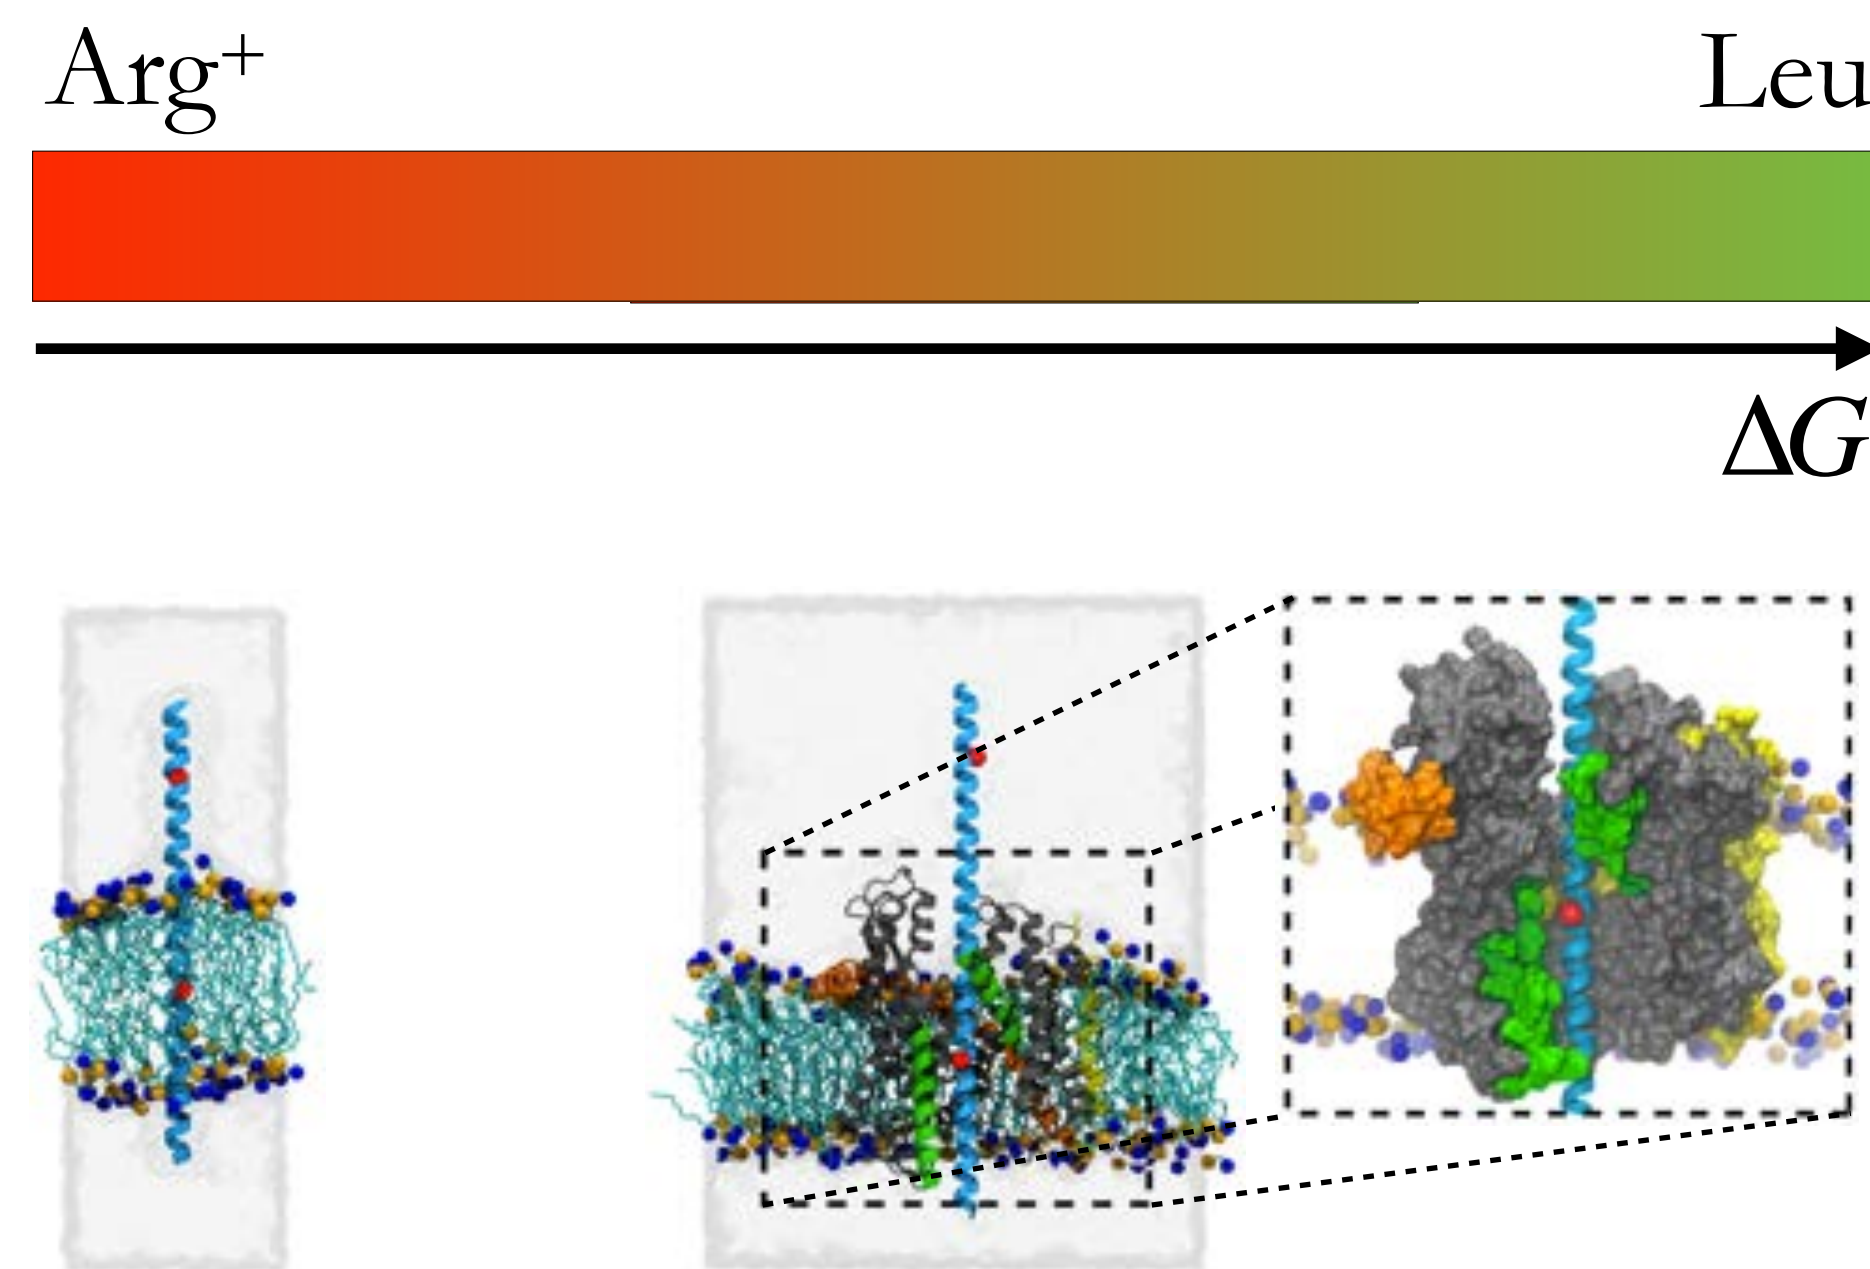

Nascent membrane proteins typically insert into the membrane via the Sec-translocon.

Membrane insertion of arginine, for instance, requires 14–17 kcal/mol according to molecular dynamics simulations, but only 2–3 kcal/mol according to experiment.

How does the translocon reduce the energetic cost and gain that accompanies insertion?

NAMD Scalable Molecular Dynamics FREE-ENERGY METHODS

INTRODUCTION

The race for longer and larger simulations

What is the best method for a given problem?

ALCHEMICAL FREE-ENERGY CALCULATIONS

- A tool to address host-guest chemistry questions
- Good practices, guidelines and recommendations

GEOMETRICAL FREE-ENERGY CALCULATIONS

- Potentials of mean force and transport phenomena
- Potentials of mean force and recognition and association phenomena
- What about non-equilibrium work computer experiments?

A TOOL TO ADDRESS HOST-GUEST CHEMISTRY PROBLEMS

Transforming between chemical species, exploiting the malleability of the potential energy function.

First alchemical transformation: Methanol to ethane (6.7 vs. 6.9 kcal/mol in experiment).

Single-topology paradigm:

- A common-denominator topology for the end states of the transformation.
- The non-bonded terms are a function of a general-extent parameter, λ .
- Necessity to correct for the change of bond length — if shaken bonds.
- Requires electrostatic decoupling.

Jorgensen, W. L.; Ravimohan, C. *J. Chem. Phys.* **1985**, *83*, 3050-3054

Postma, J. P. M.; Berendsen, H. J. C.; Haak, J. R. *Faraday Symp. Chem. Soc.* **1982**, *17*, 55-67

Bash, P. A. et al. *Science* **1987**, *236*, 564-568

Bash, P. A. et al. *Science* **1987**, *235*, 574-576

A TOOL TO ADDRESS HOST-GUEST CHEMISTRY PROBLEMS

Free energy is a state function.

The free-energy difference between the end states is independent from the path followed to calculate it.

Dual-topology paradigm:

- The end states are defined explicitly.
- An exclusion list prevents them from seeing each other.
- The interaction of the perturbed state with its environment is a function of a general-extent parameter, λ .
- Prone to end-point catastrophes.
- Branching requires particular care.

Gao, J.; Kuczera, K.; Tidor, B.; Karplus, M. *Science* **1989**, *244*, 1069-1072

A TOOL TO ADDRESS HOST-GUEST CHEMISTRY PROBLEMS

FREE-ENERGY PERTURBATION

$$\exp(-\beta\Delta A) = \langle \exp(-\beta\Delta U) \rangle_0$$

- Requires the sole knowledge of the reference state.
- Formally exact for any perturbation.
- Importance-sampling method.

THERMODYNAMIC INTEGRATION

$$\Delta A = \int d\lambda \left\langle \frac{\partial U}{\partial \lambda} \right\rangle_\lambda$$

$$\Delta U(\lambda) = \lambda U_1 + (1 - \lambda)U_0$$

Landau, L. D. *Statistical physics*, 1938

Zwanzig, R. W. *J. Chem. Phys.* **1954**, 22, 1420-1426

Kirkwood, J. G. *J. Chem. Phys.* **1935**, 3, 300-313

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

How to deal with large perturbations ?

$$\Delta A = -\frac{1}{\beta} \ln \int d\Delta U P_0(\Delta U) \exp(-\beta\Delta U)$$

$$P_0(\Delta U) = \frac{1}{\sqrt{2\pi\sigma_0^2}} \exp\left[-\frac{(\Delta U - \langle\Delta U\rangle_0)^2}{2\sigma_0^2}\right]$$

$$\Delta A \leq \langle\Delta U\rangle_0$$

$$\Delta A = \langle\Delta U\rangle_0 - \frac{1}{2}\beta\sigma_0^2$$

Stratification strategies

$$\Delta A = -\frac{1}{\beta} \sum_i \ln \langle \exp(-\beta\Delta U_{i,i+1}) \rangle_i$$

Valleau, J. P.; Card, D. N. *J. Chem. Phys.* **1972**, *57*, 5457-5462

Chipot, C.; Pohorille, A. *Free energy calculations. Theory and applications in chemistry and biology*, **2007**

Lelièvre, T.; Stoltz, G.; Rousset, M. *Free energy computations: A mathematical perspective*, **2010**

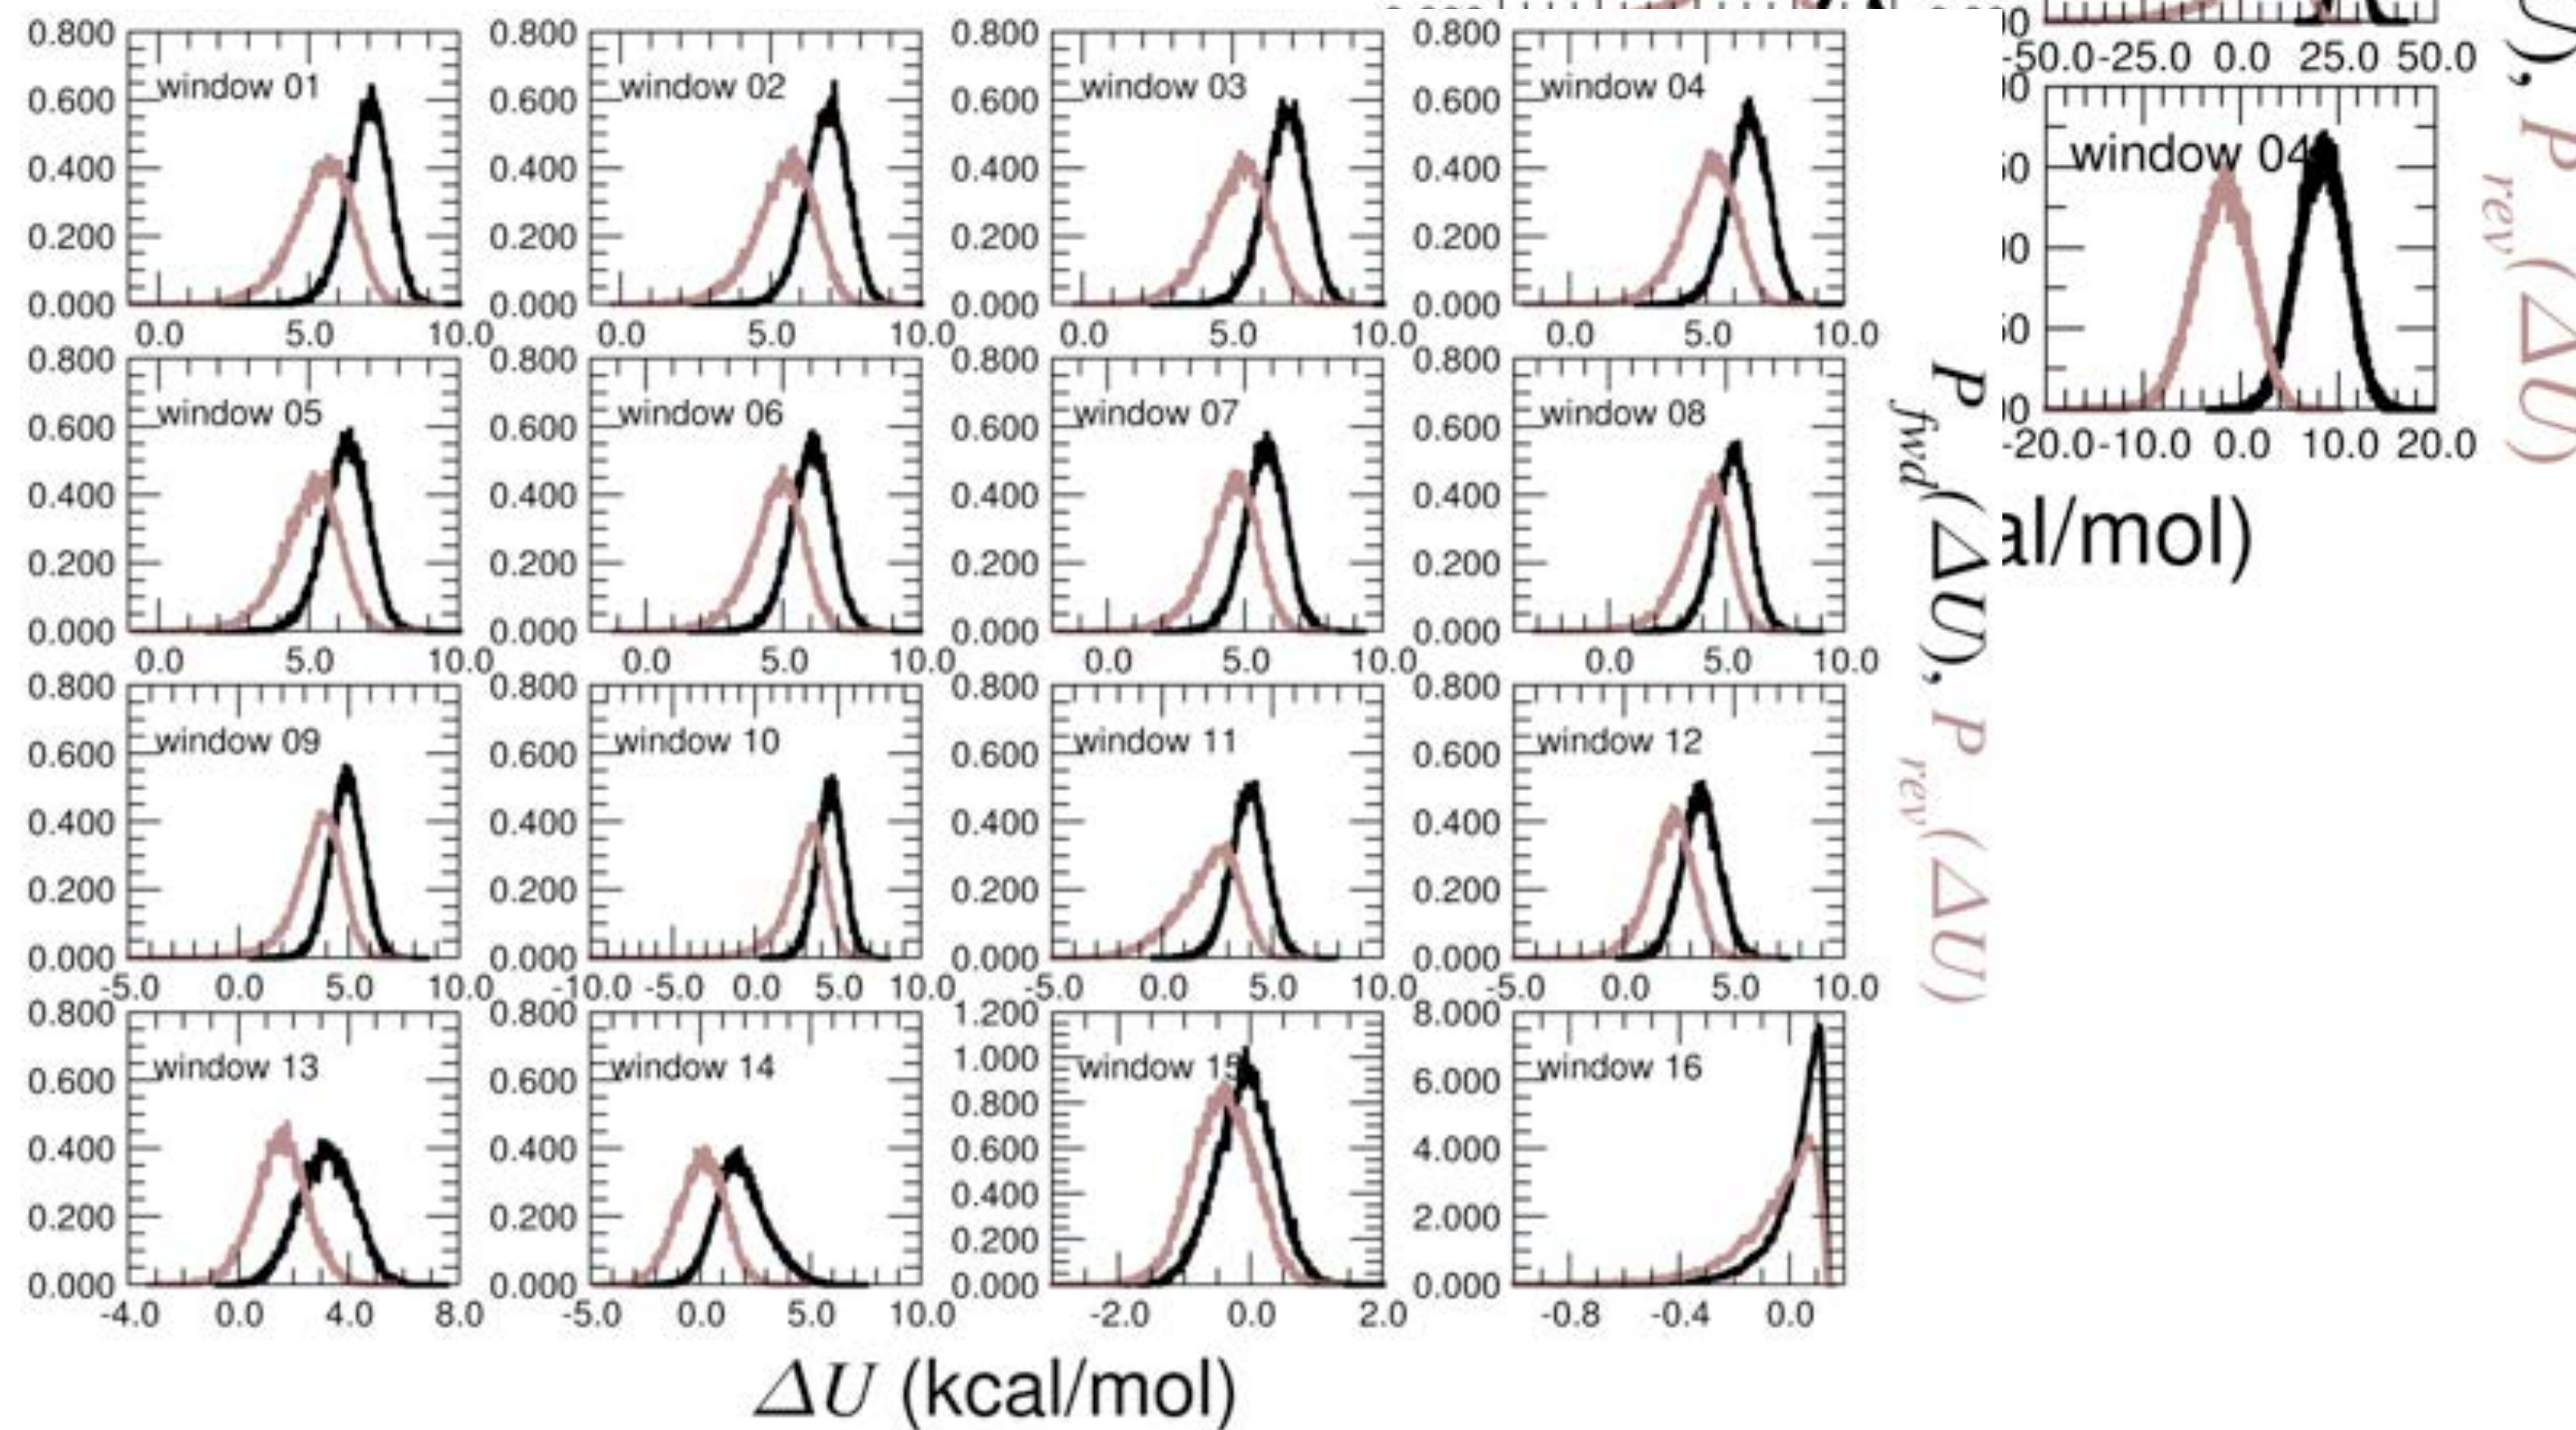

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

**How many strata should I choose ?**

Stratification will impact the accuracy of the free-energy calculation.

In the NAMD lingo:

```
runFEP 0.0 1.0 0.0625 $nSteps
```

Valleau, J. P.; Card, D. N. *J. Chem. Phys.* **1972**, *57*, 5457-5462

Pohorille, A.; Jarzynski, C.; Chipot, C. *J. Phys. Chem. B* **2010**, *114*, 10235-10253

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

**Combining forward and backward transformations**

Maximum-likelihood estimator of the free-energy change.

Guarantees the minimum variance.

$$\begin{cases} \exp(\beta \Delta \hat{A}^{\text{BAR}}) = \frac{\langle f[-\beta(\Delta U - c)] \rangle_1}{\langle f[+\beta(\Delta U - c)] \rangle_0} \exp(+\beta c) \\ c = \Delta \hat{A}^{\text{BAR}} + \frac{1}{\beta} \ln \frac{N_1}{N_0} \quad f(x) = 1/[1 + \exp(x)] \end{cases}$$

$$\sigma_{\Delta A}^2 \text{ BAR} = \frac{1}{N_0 \beta^2} \left[\frac{\langle f^2(x) \rangle_0}{\langle f(x) \rangle_0^2} - 1 \right] + \frac{1}{N_1 \beta^2} \left[\frac{\langle f^2(-x) \rangle_1}{\langle f(-x) \rangle_1^2} - 1 \right]$$

Bennett, C. H. *J. Comp. Phys.* **1976**, *22*, 245–268.

Pohorille, A.; Jarzynski, C.; Chipot, C. *J. Phys. Chem. B* **2010**, *114*, 10235-10253

Hahn, A. M.; Then, H. *Phys. Rev. E Stat. Nonlin. Soft Matter Phys.* **2009**, *80*, 031111

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

**Double-wide sampling**

Ensemble averages carried out with respect to the initial state, λ_i .

More effective than two independent free-energy calculations.

Possible Hamiltonian lag requires proper thermalization at each stratum.

Readily supplies the relevant information for Bennett acceptance ratio analysis.

Readily supplies the hysteresis of the transformation.

Liu, P.; Dehez, F.; Cai, W.; Chipot, C. *J. Chem. Theor. Comput.* **2012**, *8*, 2606-2616

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

What about end-point catastrophes ?

Avoid singularities in the van der Waals potential as particles appear.

$$U^{\text{vdW}}(r_{ij}; \lambda) = 4\epsilon_{ij}(1 - \lambda) \left[\left(\frac{\sigma_{ij}^2}{r_{ij}^2 + \alpha\lambda} \right)^6 - \left(\frac{\sigma_{ij}^2}{r_{ij}^2 + \alpha\lambda} \right)^3 \right]$$

$$U^{\text{vdW}}(r_{ij}; \lambda) = 4\epsilon_{ij}(1 - \lambda)^n \left\{ \frac{1}{\left[\alpha\lambda^2 + \left(\frac{\sigma_{ij}}{r_{ij}} \right)^6 \right]^2} - \frac{1}{\alpha\lambda^2 + \left(\frac{\sigma_{ij}}{r_{ij}} \right)^6} \right\}$$

Zero free-energy change transformation

Pearlman, D. A.; Kollman, P. A. *J. Chem. Phys.* **1991**, *94*, 4532-4545

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

Scheduling the electrostatic decoupling:

Outgoing particles

	beginning	end
electrostatics	0	$1 - \lambda_{\text{elec}}^{\text{start}}$
van der Waals	$1 - \lambda_{\text{vdW}}^{\text{end}}$	1

Decoupling in the NAMD lingo:

```
alchVdwLambdaEnd      0.7
alchElecLambdaStart   0.5
```

Incoming particles

	beginning	end
electrostatics	$\lambda_{\text{elec}}^{\text{start}}$	1
van der Waals	0	$\lambda_{\text{vdW}}^{\text{end}}$

HOW ABOUT THE ENTROPY ?

Appreciably more challenging to estimate on account of averages over U_0 and U_1 .

$$\Delta S = \frac{1}{T} \left(\frac{\langle U_1 \exp(-\beta \Delta U) \rangle_0}{\langle \exp(-\beta \Delta U) \rangle_0} - \langle U_0 \rangle_0 \right) + k_B \ln \langle \exp(-\beta \Delta U) \rangle_0$$

Alternate route:

$$\Delta S = - \left(\frac{\partial \Delta A}{\partial T} \right)_{N,V}$$

Wan, S.; Stote, R. H.; Karplus, M. *J. Chem. Phys.* **2004**, *121*, 9539–9548

Kubo, M. M.; Gallicchio, E.; Levy, R. M. *J. Phys. Chem. B* **1997**, *101*, 10527-10534

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

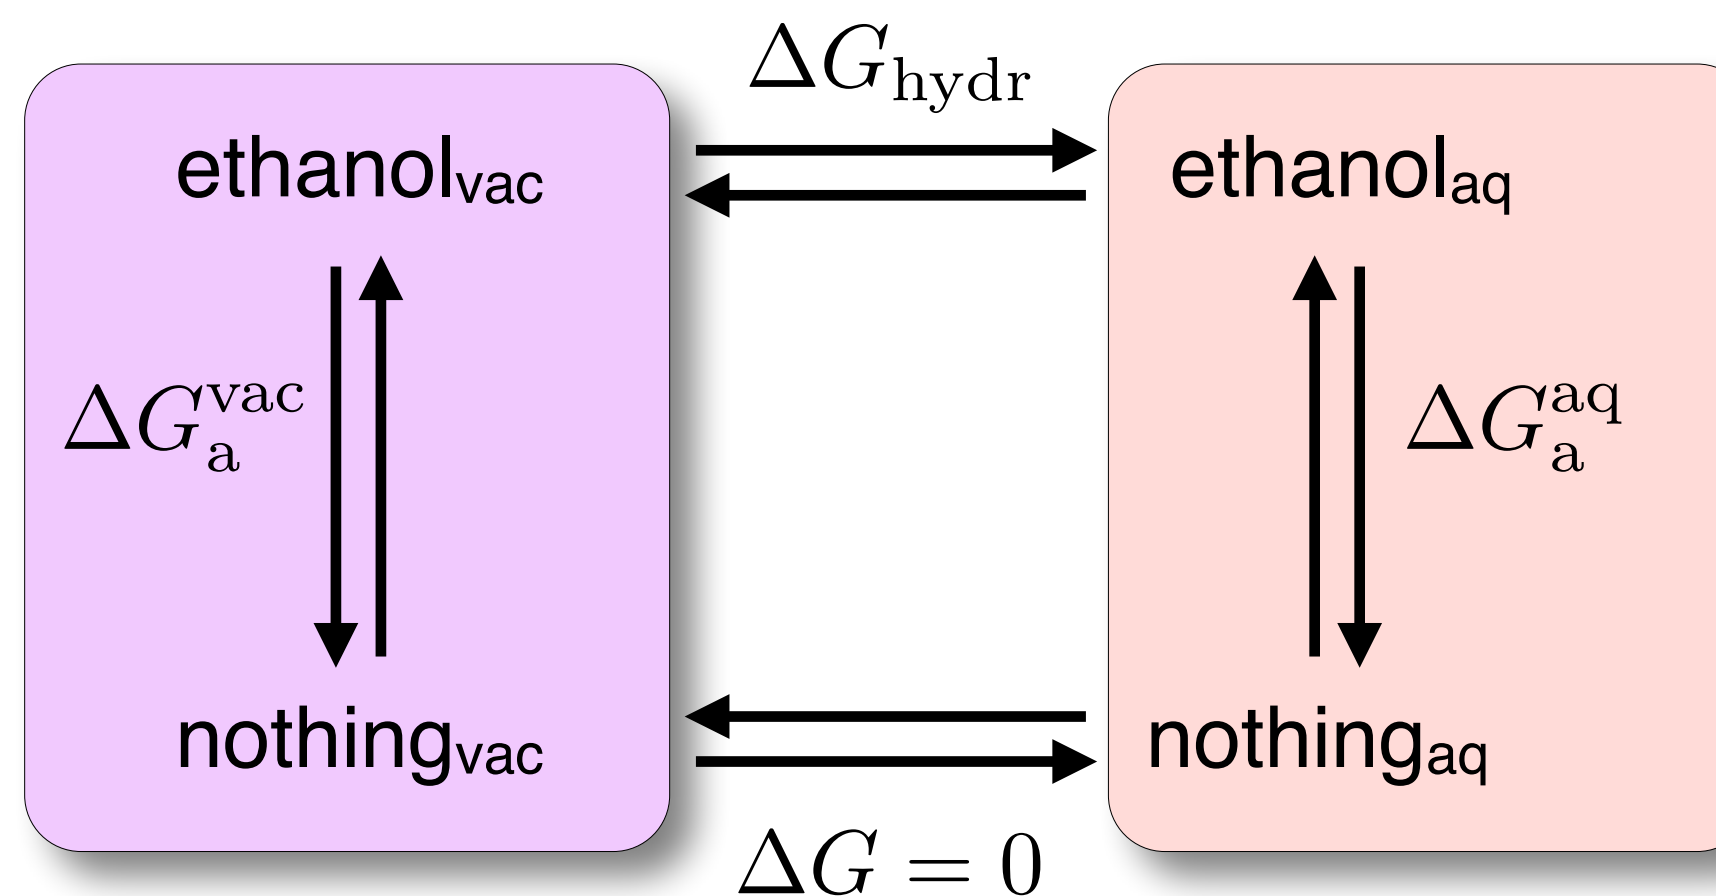

bulk

vacuum

Ethanol hydration

Why do I need to complete the full thermodynamic cycle ?

In different dielectric environments, molecules may adopt very different conformations, corresponding to distinct intramolecular interactions.

In NAMD lingo: `AlchDecouple off`

Not a free-energy calculation in vacuum per se, but in a periodic cell bereft of solvent.

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

Exercise 2. Ethanol hydration

bulk

vacuum

	ΔG (kcal/mol)		
	annihilation	creation	BAR
vacuum	+5.1	-5.3	-5.2
water	+9.5	-9.6	-9.6
hydration	+4.4	-4.3	-4.4

experiment: -5.1 kcal/mol

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

Stratification provides an effective, general method for reducing the variance and improving overlap at each stage.

$$\exp(-\beta\Delta U)P_0(\Delta U) = \exp(-\beta\Delta A)P_1(\Delta U)$$

What should be the optimum number of strata and how much sampling per stratum is required?

$$D(P_0^{\text{eq}}||P_1^{\text{eq}}) = \int P_0^{\text{eq}} \ln\left(\frac{P_0^{\text{eq}}}{P_1^{\text{eq}}}\right) \geq 0$$

$$W_{\text{dissipative}}^0 \equiv \langle \Delta U \rangle_0^{\text{eq}} - \Delta A$$

$$\begin{cases} N_0 \sim \exp(\beta W_{\text{dissipative}}^1) \\ N_1 \sim \exp(\beta W_{\text{dissipative}}^0) \end{cases}$$

Kofke, D.; Cummings, P. *Fluid Phase Equil.* **1998**, *150*, 41-49

Chipot, C.; Pohorille, A. *Free energy calculations. Theory and applications in chemistry and biology*, **2007**

Pohorille, A.; Jarzynski, C.; Chipot, C. *J. Phys. Chem. B* **2010**, *114*, 10235-10253

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

All free-energy calculations should be accompanied by an error estimate. A distinction between statistical and systematic error ought to be made.

Since the reliability of free-energy estimates depends on the overlap between $P_0(\Delta U)$ and $P_1(\Delta U)$, these distributions should be monitored to assess the degree of overlap, or lack thereof, as a measure of inaccuracy:

$$\frac{\delta \epsilon_{\Delta A}}{\exp(-\beta \Delta A)} = - \int_{-\infty}^{\Delta U_0} d\Delta U P_1(\Delta U)$$

Combining forward and backward simulations using, for instance, the BAR estimator is strongly recommended.

A HOST OF METHODS TO MEASURE FREE-ENERGY CHANGES

The derivative of the free energy with respect to the order parameter may be expressed as a sum of configurational averages at constant ξ :

$$\begin{cases} \nabla A(z) := \mathbb{E}\{F(\mathbf{x})|\xi(\mathbf{x}) = z\} \\ F(\mathbf{x}) = \frac{\nabla U(\mathbf{x}) \cdot \nabla \xi}{|\nabla \xi|^2} - \frac{1}{\beta} \cdot \nabla \left(\frac{\nabla \xi}{|\nabla \xi|^2} \right) \end{cases}$$

$\mathbf{v}_{i, i \in [1, \dots, n]}$ are arbitrarily chosen vector fields of $\mathbb{R}^{3N} \rightarrow \mathbb{R}^{3N}$, which verify $\mathbf{v}_i \cdot \nabla_{\mathbf{x}} \xi_j = \delta_{ij}, \forall i, j$.

The i -th partial derivative of the free energy surface is calculated as the ensemble average of the thermodynamic force:

$$\nabla A(z) = \left\langle \mathbf{v}_i \cdot \nabla U(\mathbf{x}) - \frac{1}{\beta} \nabla \cdot \mathbf{v}_i \right\rangle$$

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

ξ ought to be completely decoupled from degrees of freedom to which holonomic constraints are applied. **Issue solved in NAMD 2.12.**

As a matter of principle, ξ ought to be stratified: $t_0 > \sum_i t'_i$

Turn to the extended-Lagrangian formulation of ABF in the event geometrical restraints are coupled to ξ .

ExtendedLagrangian on

$$F(\mathbf{x}) = \frac{\nabla U(\mathbf{x}) \cdot \nabla \xi}{|\nabla \xi|^2} - \frac{1}{\beta} \cdot \nabla \left(\frac{\nabla \xi}{|\nabla \xi|^2} \right)$$

GOOD PRACTICES, GUIDELINES AND RECOMMENDATIONS

In stratified ABF calculations, continuity of the average force ought to be verified.

Free-energy profiles ought to be provided with error bars, $\sigma_{\Delta A} \simeq \frac{\sigma}{N^{1/2}} (1 + 2\kappa)^{1/2}$

Assess convergence, for instance, by breaking down the free-energy calculations in multiple sub-runs and compute a root mean-square deviation with respect to the last one.

WHAT ABOUT NON-EQUILIBRIUM WORK COMPUTER EXPERIMENTS ?

$$\exp(-\beta\Delta A) = \langle \exp(-\beta w) \rangle$$

Pulling simulations are usually carried out at a velocity about 10^3 greater than that of experiment.

$$\frac{P_0(+w)}{P_1(-w)} = \exp[+\beta(w - \Delta A)]$$

Akin to BAR, combine the forward and backward transformations to reduce the variance.

Though cumulant expansions help, the non-equilibrium work route to free-energy differences requires near-equilibrium conditions to converge.

In general, there is no fundamental reason to resort to non-equilibrium work experiments if the free-energy change can be estimated at equilibrium.

WHAT DO I NEED FOR THIS WORKSHOP ?

- An up-to-date version of NAMD
- An up-to-date version of VMD, featuring the ParseFEP plugin
- The bundle of hands-on exercises, which can be downloaded from:

<http://www.ks.uiuc.edu/Training/Tutorials>
